Animalia. This system of classification is currently accepted by most biologist.

The three domain system is based on the current state of knowledge. As knowledge of organisms increase in the future, classification will undoubtedly continue to change.

Infobits

The ***Bergey's Manual of Systematic Bacteriology***'s first edition was published initially in four volumes. Volume 1 included Gram negative bacteria of general, medical or industrial importance, Volume 2 included Gram positive bacteria other than actinomycetes, Volume 3 included Cyanobacteria, Archaebacteria and remaining Gram negative bacteria and Volume 4 included Actinomycetes.

The current grouping edition 2 (2012) has five volumes based on 16S rRNA sequencing:

Volume 1 (2001) includes Archaea and the deeply branching and phototrophic Bacteria.

Volume 2 (2005) includes Proteobacteria.

Volume 3 (2009) includes Firmicutes.

Volume 4 (2011) includes Bacteroidetes, Spirochaetes, Tenericutes (Mollicutes), Acidobacteria, Fibrobacteres, Fusobacteria, Dictyoglomi, Gemmatimonadetes, Lentisphaerae, Verrucomicrobia, Chlamydiae, and Planctomycetes.

Volume 5 (in two parts) (2012) includes Actinobacteria.

8.6 The Past and Present State of Bacterial Taxonomy

The first classification scheme for bacteria was published in 1773 based on morphological characteristics. One of the unique, broadscope and widely accepted classification scheme was published in 1927 by David Bergey & colleagues is Bergey's Manual of Determinative Bacteriology.

It provides identification schemes for identifying Bacteria and Archae based on their morphology, differential staining and biochemical tests. Whereas in 1984, a more detailed work was entitled. Bergey's manual of Systematic Bacteriology provides information on Bacteria and Archaea based on rRNA sequencing. The classification in Bergey's Manual is accepted by the most microbiologists as the best consensus for prokaryotic taxonomy.

The present classification scheme based on genetic relatedness has more practical value. This is expected to provide greater stability and predictability. It would lead to improved identification schemes, and to aid our understanding of the origin of present day genera and species.

Summary

The branch of science which deals with the classification, nomenclature and identification of all living organisms is called taxonomy. The system of naming living organisms is called as nomenclature. Carolus Linnaeus divided all living organisms into two kingdoms- Animalia and Plantae. He introduced Binomial Nomenclature for naming living organisms. Whittaker
