proposed five kingdom classification based on various properties of living organisms. Currently accepted classification proposed by Woese, Kandler and Wheelis is the three domain classification. Modern developments of sequencing technologies and recognition of rDNA sequences are of now cornerstone for identification purposes.

Overall, it is important to recognize that microbial diversity is very much linked to its environment and the correlation has to be established by description of environmental parameters whenever sampling is carried out. It is also important to study the phenotypic characteristics and link them to the observations obtained from genotyping techniques. The link between habitat and diversity then becomes easier to understand for future studies.

Student Activity

The student must understand the characteristics of each domain under the five kingdom classification and fill in the chart below.
