process converting CO_2 to CH_4. It is carried out by methanogens like *Methanobacterium* sp. Phosphorous transformations mostly happen as inter conversion of inorganic to organic phosphate and insoluble form to soluble phosphates.Purple and green sulphur bacteria store sulphur as granules as a result of which they appear yellow in colour.

Biofertilizers are preparations containing beneficial micro organisms like N_2 fixers, PO_4 solubilizers in a viable static state intended for seed or soil application and designed to improve soil fertility. *Azolla* and *Anabaena* share symbiotic relationship in which *Anabaena* provides fixed atmospheric nitrogen to *Azolla*.

Vesicles and arbuscles in VAM fungi are the storage organelles of polyphosphates.Blue Green algae are prokaryotes that can perform both photosynthesis and nitrogen fixation.

Biopesticides refer to compounds that are used to manage agricultural pests by means of specific biological effects. *Bacillus thuringiensis* produces crystal toxin which is detrimental to insects.

Bacterial Biopesticide - *Bacillus thuringiensis*
