Table 12.10: Microbial diseases of the Nervous system

Diseases	Pathogen	Portal of Entry	Method of Transmission
Bacterial Diseases			
Haemophilus influenzae meningitis	*Haemophilus. Influenzae*	Respiratory tract	Endogenous infection; aerosols
Meningococcal meningitis	*Neisseria meningitidis*	Respiratory tract	Aerosols
Pneumococcal meningitis	*Streptococcus pneumoniae*	Respiratory tract	Aerosols
Tetanus	*Clostridium tetani*	Skin	Puncture wound
Botulism	*Clostridium botulinum*	Mouth	Food borne intoxication
Viral Diseases			
Poliomyelitis	Poliovirus	Mouth	Ingesting contaminated water (fecal oral route)
Rabies	Lyssavirus, including rabies virus	Skin	Animal bite
Fungal Diseases			
Cryptococcosis	*Cryptococcus neoformans*	Respiratory route	Inhaling soil contaminate with spores
Protozoan Diseases			
African trypanosomiasis	*Trypanosoma brucei Rhodesiense, Trypanosoma brucei gambiense*	Skin	Tsetse fly

12.9 Systemic Infections

An infection that is in the bloodstream is called a systemic infection. Systemic diseases such as flu and typhoid affect the entire body. Bacteria can enter the circulatory and lymphatic systems through acute infections or breaches of the skin barrier or mucosa. Breaches may occur through fairly common occurrences, such as insect bites or small wounds. Even the act of tooth brushing, which can cause small ruptures in the gums may introduce bacteria in to the circulatory system. In most cases, the Bacteremia result from such common exposure is transient and remains below the threshold of detection. In severe cases, bacteremia can lead to septicemia with dangerous complication such as Toxemia sepsis and Septic shock. In these situations, it is often the immune response to the infection that result in the clinical signs and symptoms rather than microbes themselves.

Summary

In the branch of medical microbiology we discussed about prevention, diagnosis and
