treatment of infectious diseases. Infections are acquired through contact, inhalation, ingestion, inoculation and congenital. Sources of infections are endogenous and exogenous in origin. Normal flora are organisms present in certain areas of the body. Infectious diseases may be generalised or localised. Based on the occurrence of infectious diseases the infection may be epidemic, endemic, or sporadic. There are various virulence factors which are responsibility for the pathogenicity.

Skin is the first line of defence against pathogen. Normal uninterrupted skin provides protection against "invasion by bacteria". Many exogenous and endogenous factors are responsible for wound infections. The mechanism of damage may be in the skin or some cases its spreads to the internal organs and CNS system.

Respiratory system of both lower and upper is the major path for entry of pathogens. The infections of upper respiratory tract are sinusitis, pharyngitis, laryngitis and epiglottitis. The infection of lower respiratory tract are trachitis, tracheobronchitis, bronchitis, and alveolitis.

Gastrointestinal tract infections are infections of the digestive system. The food borne infection and food intoxication are the common cause of gastroenteritis. The gut flora and natural defence mechanism by defensins bacteriocins, globet cells, IgA antibodies protect the individual against pathogenic infection. Diarrhea, dysentery, vomitting are the common symptoms of GIT. Oral rehydration therapy, proper hygiene to be manifested to reduce the risk of gastroenteritis.

The external structure and parts of the eye are easily susceptible to infections. The eyelids, tears, lysozyme, IgA are the natural defence against infections. Conjunctivitis and Trachoma are the common eye diseases. Proper diagnosis and treatment should be suggested.

Uninary tract infections are more common in females than in males. There are many predisposing factors making female prone to the infections. The predominant causative agents in urinary tract infection is *Escherichia.coli*. The number of organisms in freshly passed urine is more than 100,000 organisms/ml. It is called significant bacteriuria.

The infections spread through reproductive tract by direct contact is called sexually transmitted disease. Mostly these infections are asymptomatic in women.

Nervous system infection affect brain and spinal cord. They are of two types meningitis and encephalatis. An infection that is in the blood stream is called systemic infections. Systemic diseases like flu and typhoid affect the entire body.
