The success of vaccination enabled the World Health Organization to announce in 1979 that small pox had been eradicated. Late in 19th century Robert Koch proved that infectious diseases are caused by microorganisms. The discoveries of Koch stimulated the extension of Jenner's strategy of vaccination to other diseases.

Pasteur used attenuated culture and called it vaccine (Latin vacca, cow) in honour of Edward Jenner. Table 13.1 and Figure 13.1 list and shows the scientist who contributed to the field of immunology.

Table 13.1: Scientists and their contributions to immunology

Year	Name of the Scientists	Contributions to immunology
1796	Edward Jenner	Discovered that cowpox or vaccinia, induced protection against human small pox
Discovery of humoral and cellular immunity		
1890	Von Behring and Kitasto (von Behring earned the Nobel Prize in medicine in 1901)	Gave the first insights into the mechanism of immunity
1930's	Kabat	Showed that gamma - globulin (now immunoglobulin) a fraction of serum exhibited the active component of immunity
1883	Elie Metchnikoff	He observed that certain white blood cells, which he termed **phagocytes**, were able to ingest microorganisms and other foreign material
1903	Sir Almoth Wright	Reported that antibodies could aid in the process of phagocytosis. Wright called these antibodies '**opsonins**'
1996	Claman, Chaperon and Triplett	Discovered the presence and cooperation of B cells and T cells
