

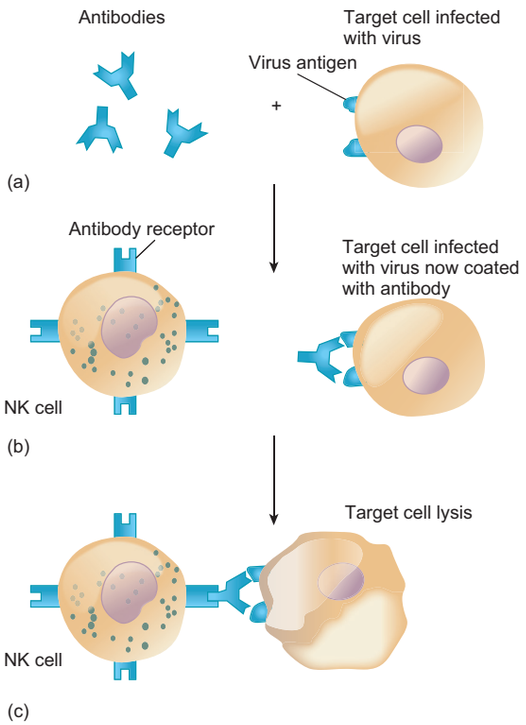

Figure 13.15: Antibody-Dependent Cell-Mediated Cytotoxicity

all nucleated host cells known as class II MHC molecules. If a hosts cell loses this MHC protein, as when some viruses or cancers overtake the cell, the NK cells kill it by releasing pore forming proteins and cytotoxic enzymes called granzymes (Figure 13.16).

13.4 Immunity

To establish an infection, an invading microorganism must first overcome many surface barriers, such as skin, degradative enzymes and mucus. These surface barriers have either direct antimicrobial activity or inhibit attachment of the microorganism to the host. Any microorganism that penetrates these barriers encounters two levels of resistance: nonspecific resistance mechanisms and the specific immune response.

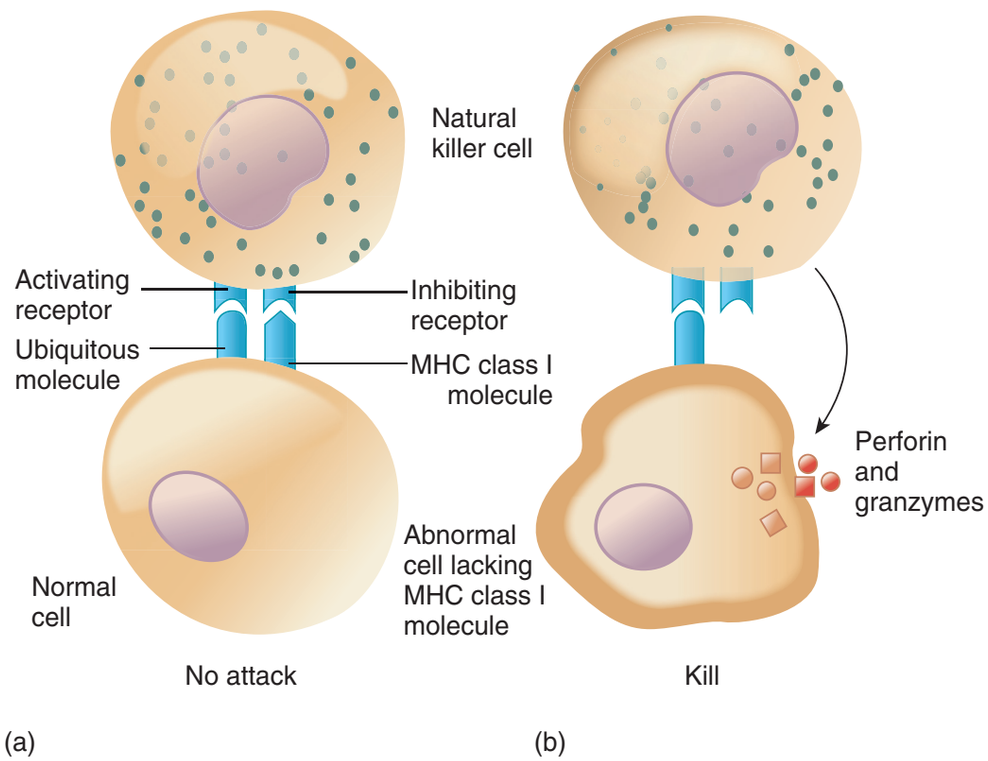

Figure 13.16: The system used by natural killer cells to recognize normal cells and abnormal cells that lack the Major Histocompatibility Complex Class I surface molecule
