Activity - 1

Perform the experiment of tossing two coins at a time. List out the following in the above experiment.	Perform the experiment of throwing two dice at a time. List out the following in this experiment also.
Random experiment : Possible outcomes : Sample space : Any three subsets of S : (or any 3 events)	Random experiment : Possible outcomes : Sample space : Any three subsets of S : (or any 3 events)

Activity - 2

Each student is asked to flip a coin 10 times and tabulate the number of heads and tails obtained in the following table.

Number of tosses	Number of times head comes up	Number of times tail comes up
⋮	⋮	⋮

(i) Fraction 1 : $\dfrac{\textit{Number of times head comes up}}{\textit{Total number of times the coin is tossed}}$

(ii) Fraction 2 : $\dfrac{\textit{Number of times tail comes up}}{\textit{Total number of times the coin is tossed}}$

Repeat it by tossing the coin 20, 30, 40, 50 times and find the fractions.

Activity - 3

Divide the class students into groups of pairs. In each pair, the first one tosses a coin 50 times, and the second one records the outcomes of tosses. Then prepare a table given below.

Group	Number of times head comes up	Number of times tail comes up	$\dfrac{\text{Number of times head comes up}}{\text{Total number of times the coin is tossed}}$	$\dfrac{\text{Number of times tail comes up}}{\text{Total number of times the coin is tossed}}$
