GAUGE BLOCK

Carl Edvard Johansson:

Gauge blocks were invented in 1896 by Swedish machinist Carl Edvard Johansson. They are used as a reference for the calibration of measuring equipment used in machine shops, such as micrometers, sine bars, calipers, and dial indicators (when used in an inspection role).

Gauge blocks are the main means of length standardization used by industry.

Gauge blocks (also known as gage blocks, Johansson gauges, slip gauges, or Jo blocks) are a system for producing precision lengths.

The individual gauge block is a metal or ceramic block that has been precision ground and lapped to a specific thickness.

Gauge blocks come in sets of blocks with a range of standard lengths. In use, the blocks are stacked to make up a desired length.

is lower and if the gauge number is lower, the thickness will be higher. Wire gauge is a rounded plate which has holes of various sizes and has a provision to insert the rounded plates at the edge. Gauge numbers are marked on the gauge plate. Shown in Fig 2.3.1(d).

e) Voltmeter

The voltmeter is an instrument which is used to measure the voltage across the electrical circuit. The unit of voltage is "volt". It is used as 240 volts in homes and 440 volts at workstations. Fig 2.3.1(e) shows Voltmeter.
