

Figure 5.3.7.3(b) Dome Piston

c) Concave head piston

In this type, the piston head is of concave in structure. Due to this, high pressure is produced inside the combustion chamber. These types of piston are used in high compression diesel engines. Concave like structure helps in increasing air turbulence which leads to proper mixing and results in good combustion.

5.3.7.4 Piston arrangement

The upward and downward motion of cylindrical object inside the cylinder is called piston. Piston consists of heat dam, land, skirt, piston pin boss, rings, grooves. Heat dam is a thin groove cut on the piston head between the top ring groove and the top of the piston. There are slots for compression and oil rings. Below these slots, holes are made for piston pin or piston boss. Slots are present on the

piston skirt. Cylinder liner present inside the cylinder acts as sliding surface for piston.

a) Piston Pin

A piston pin is a hollow shaft that connects the small end of the connecting rod to the piston. It is made up of special alloy steel to prevent wear and tear.
