electromagnetic waves like radio frequencies, infrared, satellite, etc., in a wireless communication technology network.

## Types of Wireless Communication Technologies

The devices used for wireless communication are cordless telephones, mobiles, GPS units, wireless computer parts, and satellite television.

### 14.5.1.Bluetooth

It is named after a Danish king named Harald Bluetooth. Bluetooth is used to connect different electronic devices wirelessly to a system for transferring and sharing data. Cell phones are connected to hands-free earpieces, wireless keyboard, mouse and mike to laptops with the help of Bluetooth as it transmits information from one device to other device.

### Infrared

Infrared technology is a type of wireless communication technology to transfer data between two infrared enabled devices through infrared radiation. This technology plays a very important role in wireless data communication. Infrared is used in devices such as the mouse, wireless keyboard and printers.

Unlike Wi-Fi and Bluetooth technologies, infrared network signals cannot penetrate walls or other obstructions and work only with a direct line of sight.

Due to its short-range communication system, the use of an infrared communication system in one room will not be affected by the use of another system in the next room. This is why using an infrared TV remote control in our home will not interfere with the use of our neighbour's infrared TV remote control.

DO YOU KNOW?

They also operate in diffuse mode, also called scatter mode. This means that the source and destination are not directly visible to each other. An example is a television remote-control box. The box does not have to be pointed directly at the set, although the box must be in the same room as the set, or just outside the room with the door open.

DO YOU KNOW?

Line-of-sight transmission is a characteristic of electro magnetic radiation which means waves will travel in a direct path from the source to the receiver.
