

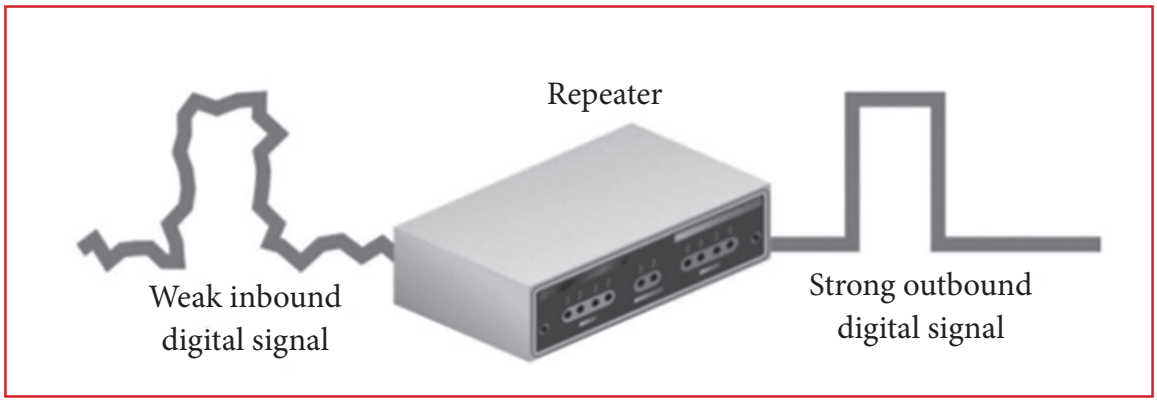

Figure 14.19 Repeater

Gateway

A network gateway joins two networks so the devices on one network can communicate with the devices on another network. Gateways serve as the entry and exit point of a network. For basic Internet connections at home, the gateway is the Internet Service Provider that gives you access to the entire Internet.

A gateway is often associated with a router. Routers can be gateways because a router can control the path through which information is sent in and out.

The default gateway is the machine IP number that you need to access to get to the rest of the network or the Internet.

14.7. Identifying computers and users over a network

14.7.1. Basic concept of domain name

- A domain name is a unique name that identifies a website. Each website has a domain name that serves as an address, which is used to access the website. For example, "google.com" is a domain name.
