membrane bound nucleus and cell organelles like chloroplast, mitochondria, endoplasmic reticulum, golgi bodies etc., Pyrenoids are present. They are proteinaceous bodies found in chromatophores and assist in the synthesis and storage of starch. The pigmentation, reserve food material and flagellation differ among the algal groups.

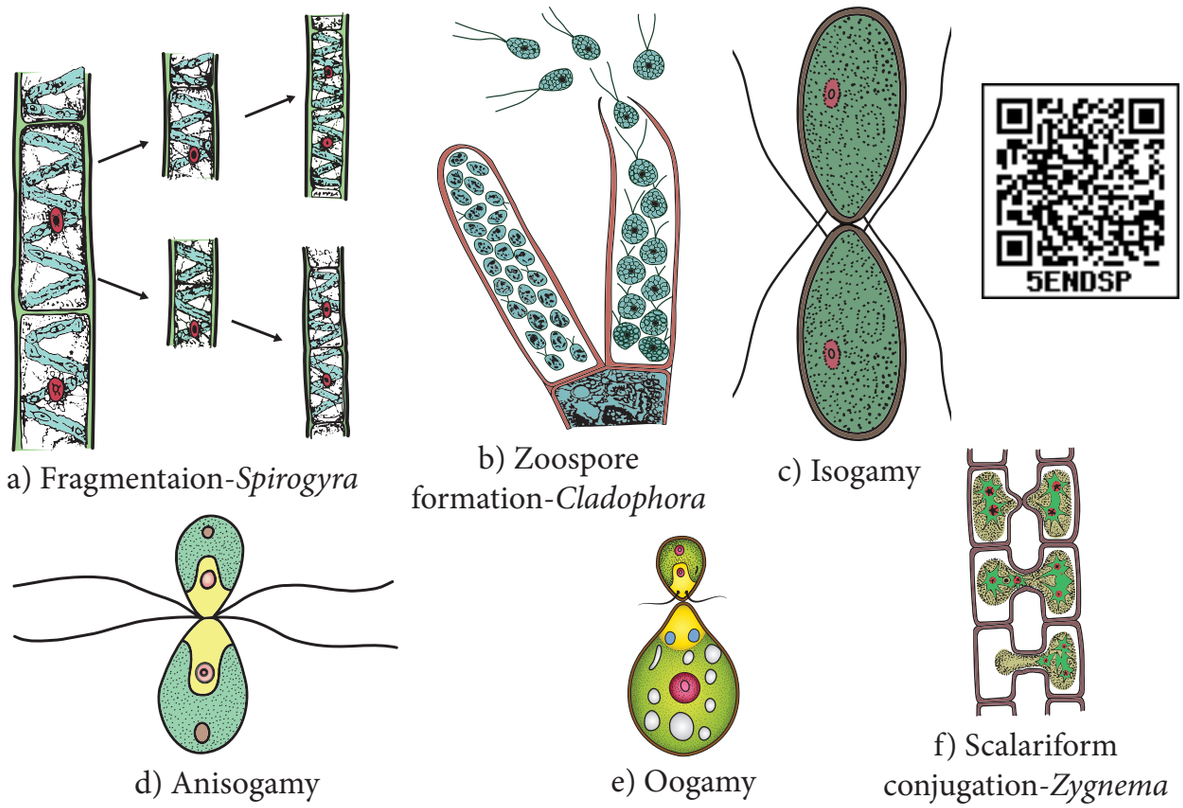

Algae reproduces by vegetative, asexual and sexual methods (Figure 2.4). Vegetative reproduction includes fission (In unicellular forms the cell divides mitotically to produce

a) *Chlorella* b) *Chlamydomonas* c) *Vaucheria* d) *Oedogonium*

e) *Coleochaete* f) *Fritschiella* g) *Ulva* h) *Fucus* i) *Sargassum*

Figure 2.3: Thallus organization in Algae

a) Fragmentaion-*Spirogyra* b) Zoospore formation-*Cladophora* c) Isogamy

d) Anisogamy e) Oogamy f) Scalariform conjugation-*Zygnema*
