d) Isomaltose (disaccharide) (Glucose + Glucose)

e) Raffinose (Trisaccharide) (Fructose + Glucose + Galactose)

f) Stachyose (tetrasaccharide) (Galactose + Galactose + Glucose + Fructose)

g) Verbascose (pentasaccharide) (Galactose + Galactose + Galactose + Glucose + Fructose)

5.2.3 Polysaccharides

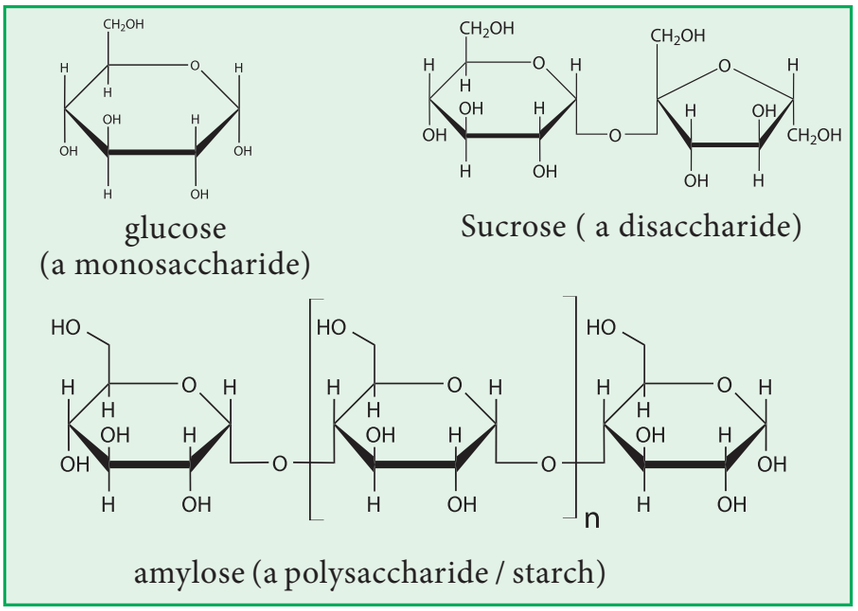

Polysaccharides are the carbohydrates which yield more than ten molecules of monosaccharides on hydrolysis. They are usually tasteless (non-sugars). They have the general formula $(C_6H_{10}O_5)_n$.

a) The polysaccharides composed of a single type of monosaccharide are called homoglycans (or) homopolysaccharides. They have the general formula $(C_6H_{10}O_5)_n$.

Example : Starch, cellulose, glycogen, insulin.

b) Polysaccharides composed of two (or) more different types of monosaccharides are called heteroglycans (or) heteropolysaccharides.

Example : Agar, heparin, pectins, gum arabic, hyaluronic acid etc.
