

**c) Hydrolysis of starch :**

Starch is hydrolysed both by acids and enzymes. Both amylose and amylopectin are rapidly hydrolysed by α-amylase which is secreted by salivary glands and pancreas. α-Amylase acts upon starch and hydrolyses it into finally maltose molecules.

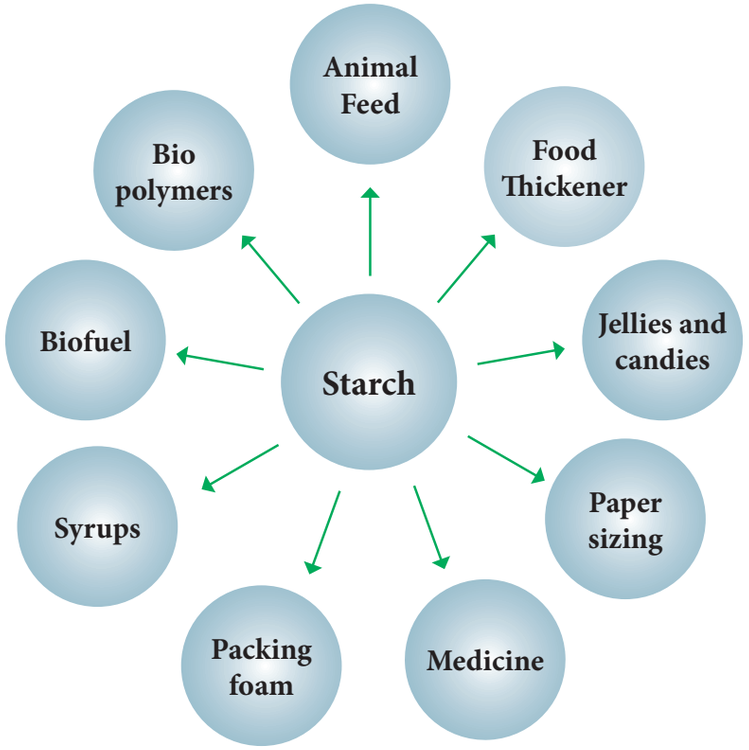

**d) Uses** : Starch is used as

(i) as a food material. (ii) for the manufacture of glucose and alcohol.

(iii) in paper industry. (iv) in textile industry. (v) in printing.

(vi) to prepare starch acetate, nitrostarch etc. (vii) for making adhesives.

(viii) as an indicator.
