2. One of the following has reducing properties……..

a) Glucuronic acid b) Gluconic acid

c) Glucaric acid d) Mucic acid

3. The end product of hydrolysis of "Starch" by amylase is ……

a) Soluble starch b) Glucose

c) Dextrins d) Maltose

4. Fructose and Glucose can be distinguished by ……

a) Seliwanoff's reagent b) Benedict's reagent

c) Fehling's reagent d) Barfoed's reagent

II. Fill up the blanks

1. Carbohydrate consists of ....., ... and ..... molecule

2. Hydrogen Oxygen atom ratio in Carbohydrate is .....

3. Molecules having only one actual sugar group is called as .....

4. Sugars having aldehyde group is called as .....

5. Sugars with keto group is called as .....

6. Compounds having same structural formula but differing in spatial configuration are known as .....

7. This change in rotation with time is called .....

8. Equimolecular mixture of glucose and fructose thus formed is called ……

9. Types of Polysaccharides are ..... and .....

10. Starch is composed of amylose and ……

III. Give short answer for the following

1. What is the structural difference between glycogen and starch?
