2. What is glycogenolysis?

3. Give the structure of sucrose.

4. What is epimerisation?

5. Mention the reaction between fructose and sodium amalgam.

6. What is racemic mixture?

IV. Answer the followings

1. What are the organic chemical groups that compose carbohydrates? How are carbohydrates classified according to the presence of those groups?

2. What are the functions of carbohydrates?

3. What is the difference between monosaccharides and disaccharides? What are some examples of them?

4. Explain the property of stereoisomerism in monosaccharides with two examples.

5. What are the reaction sequences of glucosazone formation?

6. Mention the difference between amylose and amylopectin.

7. What is the molecular formula for glucose? How can its structural formula be described?

8. What are the main biological functions of polysaccharides?

9. Explain the muta rotation of glucose.

SUMMARY

- Carbohydrates are the most abundant biomolecules, also considered as a primary source of energy.
- Structurally they can be classified as aldose (polyhydroxy aldehyde) and ketose (polyhydroxy ketones).
- Depending upon the number of sugar moiety carbohydrates, they are classified as monosaccharides, oligosaccharides and polysaccharides.
- Aldoses and ketoses are isomers of monosaccharaides .
