II Give short answers (Two marks)

1. Who discovered nucleic acid? When and how?
2. Write down the composition of nucleic acids.
3. Name the common bases present in nucleic acids.
4. What is a nucleotide? Give examples.
5. Write shortly on the sugars present in the nucleic acid.
6. Give the nucleosides and nucleotides of adenine.
7. What is a dinucleotide? Give examples.
8. Write about the directionality of nucleotides.
9. State Chargaff's rules.
10. Give the rules of base pairing.
11. What is the complementary strand for 5'GTAATTGC3'?
12. What are the major types of RNA?

III Give short answers (Three marks)

1. What are bases? How are they classified? Give example for each group.
2. List the properties of pyrimidine bases.
3. Write short notes on purine bases.
4. What are Oligo nucleotides Give examples?
5. Enumerate the functions of nucleotides.
6. Outline the differences between A, B and Z DNA.
7. List down the functions of DNA.
8. Write about the characteristic features of mRNA.
9. What are ribosomal RNAs? Give an account on them.

IV Answer the following questions in elaborate manner (Five marks)

1. List the Significance and functions of nucleic acid.
2. Detail on the bases, their types and properties.
3. Write an essay on the composition of nucleic acids.
