dissolved in fat and are insoluble in water. These vitamins are present in liver and fatty tissues and the excess can be stored in human body. The water-soluble vitamins include C and B complex vitamins (B1, B2, B3, B6, B12, Biotin, Folic acid and Pantothenic acid).

Vitamin A (Retinol) plays an essential role in the visual cycle. Its deficiency causes keratomalacia. Green leaves, meat and carrots are good sources for this vitamin.

Vitamin D which exists in two forms $D_2$ and $D_3$ is essential for absorption of calcium and phosphorous and for normal growth. Its deficiency causes rickets in children and osteomalacia in adults. Fish liver oil is rich in vitamin D.

Vitamin E is an antioxidant and its deficiency cause reproductive failure and muscular dystrophy. Groundnut oil and wheat germ oil are good sources of this vitamin.

Vitamin K is essential for the biosynthesis of prothrombin a necessary substance for blood clotting. Its deficiency causes hemorrhagic condition. Green vegetables, soybean oil and spinach are good sources for vitamin K

The B-complex vitamins work together and are essential for overall growth of organism. It helps in harvesting energy from carbohydrates, fat and protein and some other important functions.

Vitamin C is involved in cellular oxidation-reduction reactions as a hydrogen carrier. Its deficiency causes scurvy syndrome. Citrus fruits like lemon and orange are rich in vitamin C.
