becomes stiff. Vacuoles are generally pigmented. The beautiful colors of petals and fruits are due to presence of compounds such as the purple anthocyanins in the vacuole.

Functions of vacuole:

- Vacuoles aid in storing salts, nutrients, pigments, minerals, proteins, facilitating the growth of the plant and playing a vital structural role for the plant
- It serves in other functions such as protection, storage organelles for metabolites, growth and disposal of toxic excretory substances.

1.4.14.Distinguishing features of Plant and Animal Cells
