iv. Chromoprotein:

Protein containing heterocyclic compounds like porphyrins is called as chromo protein.

Example: myoglobin (in muscle).

v. Lipoprotein:

Protein conjugated with lipids is called lipoprotein.

Examples: chylomicron (in small intestine)

vi. Metalloprotein:

Protein containing metal ion is called as metalloprotein.

Examples: ceruloplasmin (in blood).

c. Derived protein:

Protein that is derived from simple or conjugated proteins by the action of acids, alkalies or enzyme is called as derived protein. These are partially hydrolysed proteins.

Example: peptones

2.2.3 Functional diversity of Proteins.

Repair and Maintenance:

Protein is termed as the building block of the body. Protein is vital in the maintenance of body tissue, including development and repair.

Hormones:

Some proteins acts as a hormones. Example: Insulin, a small protein, which regulates blood sugar level.

Enzymes:

Most of the enzymes are proteins, they act as biocatalysts in chemical reactions taking place in the body.
