2.4.4 Functions of DNA and RNA:

- The main function of nucleic acids is to store and transfer genetic information.
- DNA controls the synthesis of RNA in the cell.
- DNA transmits the genetic information to mRNA for the synthesis a specific protein.
- RNA directs synthesis of proteins.
- mRNA takes genetic message from DNA.
- tRNA transfers activated amino acid, to the site of protein synthesis.
- rRNA are mostly present in the ribosomes, and responsible for stability of mRNA.

EVALUATION

I. Choose the correct answer:

1. Glucose is a

   a. Monosaccharide b.Disaccharide c. Oligosaccharide

   d. Polysaccharide

2. An example of a heteropolysaccharide is

   a. Hyaluronic acid b. Cellulose c. Mannose

   d. Starch

3. Chylomicron belongs to the group of

   a. Metalloprotein b. Chromoprotein c. Lipoprotein

   d. Nucleoprotein

4. Long chain alcohols are present in

   a. Waxes b. Fats c. Oils

   d. Phospholipids
