Closely connected with the conservation of water supplies is the problem of afforestation. The systematic planting of suitable trees in every possible or even in impossible areas, and the development of what one can call civilized forests, as distinguished from wild and untamed jungle, is one of the most urgent needs of India. Such plantation would directly and indirectly prove a source of untold wealth to the country. They would check soil erosion and conserve the rainfall of the country from flowing away to waste, and would provide the necessary supplies of cheap fuel, and thus render unnecessary the wasteful conversion of farmyard manure into a form of fuel.

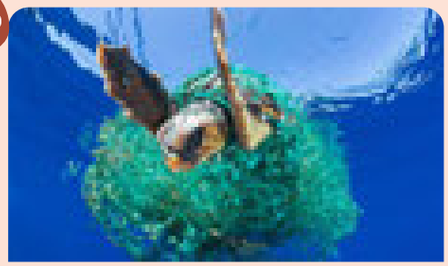

- What is the idea of civilized forest?
- How can you check soil erosion?

The measures necessary to control the movement of water and conserve the supplies of it can also serve subsidiary purposes of value to the life of the countryside. By far the cheapest form of internal transport in a country is by boats and barges through canals and rivers. We hear much about programmes of rails and road construction, but far too little about the development of internal waterways in India. Then, again the harnessing of water supplies usually also makes possible the development of hydro-electric power. The availability of electric power would make a tremendous difference to the life of the countryside and enable rural economy to be improved in various directions.

- What is the cheapest means of transport?
- How can you make a difference in the countryside?

In one sense, water is the commonest of liquids. In another sense, it is the most uncommon of liquids with amazing properties which are responsible for its unique power of maintaining animal and plant life. The investigation of the nature and properties of water is, therefore, of the highest scientific interest and is far from an exhausted field of research.

DO YOU KNOW?

The Great Pacific Garbage Patch

- It is the world's largest collection of floating trash.
- It is in the Pacific Ocean between Hawaii and California and is often described as "larger than Texas"
- Approximately 7 million tons of plastic and other debris up to 9 feet deep are floating.
- By estimation 80% of the plastic originates from land; floating in rivers to the ocean and the remaining 20% of the plastic originates from oil platforms and ships
- These trash piles are the biggest threat to the sea animals.
